The Debian Administrator's Handbook 6.1.1. Syntax. Each active line in the `/etc/apt/sources.list` file represents a package source (repository) and is made of at least three parts separated by spaces. For a complete description of the file format and the accepted entry compositions see `sources.list(5)`. Example 6.1. Example entry format in `/etc/apt/sources.list`. Chapter 12. Advanced Administration - The Debian Administrator's Handbook 12.1.1.1. Different RAID Levels. RAID is actually not a single system, but a range of systems identified by their levels; the levels differ by their layout and the amount of redundancy they provide. The more redundant, the more failure-proof, since the system will be able to keep working with more failed disks.

8.5. Creating Accounts - The Debian Administrator's Handbook The Debian Administrator's Handbook. 8.5. Creating Accounts. One of the first actions an administrator needs to do when setting up a new machine is to create user accounts. This is typically done using the `adduser` command which takes a user-name for the new user to be created, as an argument. The `adduser` command asks a few questions before .... 6.2. aptitude, apt-get, and apt Commands - The Debian Administrator's ... Note, however, that `apt-get` and `aptitude` have a very similar command line syntax. When there are major differences between these three commands, these will be detailed. 6.2.1. Initialization. For any work with APT, the list of available packages needs to be updated; this can be done simply through `apt update`.
